

Lab 10 – Saturday Night Tabletop Exercise

Industrial Security (Bachelor)

• Maps to Section 10

• 90 min, group of 6

LAB 10 **Goal**

Play out an unexpected OT incident in real time. Practise safety-first decisions, role coordination, and forensic preservation when nobody is at full strength.

 Step Scenario

Saturday, 03:00. The night-shift operator notices valves cycling on the HMI without any commanded change. The Historian shows write traffic from an engineering workstation that should be powered off. The plant manager is unreachable. Mobile reception is patchy.

Roles (one student each):

- Night-shift operator
- Control / process engineer (on-call)
- OT security lead (on-call)
- IT SOC analyst
- Plant manager (reachable after 90 min sim)
- Communications / legal lead

 Step Phase 1 – First 30 minutes (sim)

Operator notifies whom? Who has authority to act? What *not* to do? Document every decision and timestamp in a shared log.

 Step Phase 2 – 30–90 minutes (sim)

Triage. Containment options (each with process impact). Forensic preservation (network capture, HMI screenshots, Historian snapshot). External notification trigger conditions (NIS2 24-hour clock).

 Step Phase 3 – Recovery and lessons

What does “back to normal” mean? Who signs off? Three follow-ups that should be open issues by Monday morning.

 Deliverable

Hand in: the decision log with timestamps, the final containment choice with justification, and a 1-page lessons-learned summary highlighting what your team would change in the playbook.

 Caution

The instructor will inject curveballs (false alarms, contradictory information, a panicked phone call). Track what your team did right and where pressure made things worse.
