

Section 08

Industrial Security (Master)

Section 08 – Research Methods and Seminar Work

Research Methods and Seminar Work

Lecture Notes

Department of Computer Science

- 1 What is OT Security Research?
- 2 Reproducible Artefacts
- 3 Ethics and Publication
- 4 The Seminar Talk

By the end of this section you will be able to

- Distinguish industrial-security research from product-development work.
- Choose an appropriate research method (case study, measurement, experiment, design science).
- Build a reproducible artefact – dataset, tool, or testbed.
- Publish findings ethically and survive responsible-disclosure timelines.
- Prepare a seminar talk that withstands an academic audience.

1

What is OT Security Research?

Section 08 – Research Methods and Seminar Work

Academic
peer-review, novelty

Vendor R&D
patentable, productisable

Practitioner
war-stories, playbooks

All three are valid

The best OT-security work blends all three. Pure academia misses operations. Pure vendor work is constrained by IP. Pure war stories don't generalise.

Source: Wieringa, R. Design Science Methodology for IS and SE, Springer, 2014.

Method	Question it answers	Typical OT topic
Case study	“What happened, in detail?”	TRITON forensic walk-through
Measurement	“How big / how many?”	Shodan census, attack frequency
Experiment	“Does X cause Y?”	latency of intrusion detection
Design science	“Build an artefact, evaluate it.”	new IDS rule set, new protocol fuzzer
Theory building	“What explains the pattern?”	threat actor TTPs across campaigns

2

Reproducible Artefacts

Section 08 – Research Methods and Seminar Work

- Code under version control with a permissive license.
- Data with provenance, sized for download (<50 GB), and (if sensitive) anonymised.
- Containerised execution environment (Docker, Nix).
- Step-by-step README that a third party can run cold.
- Pinned dependency versions.

What kills reproducibility in ICS

Closed-source dependencies, equipment available only at one university, proprietary protocol stacks, NDAs on the data set.

Source: ACM Artifact Review and Badging policy, 2020.

iTrust SWaT & WADI testbeds

Mississippi State gas pipeline

ICS-CERT advisory corpus

Conpot honeypot logs

DARPA OpTC, CIDDs-001

netresec.com PCAP archive

Cost-effective combos

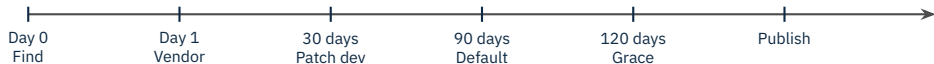

OpenPLC + ScadaBR + Simulink + Kali on a single laptop costs nothing and reproduces most academic-paper experiments.

Source: OpenPLC; Mathworks Simulink; ICS Village curriculum.

3

Ethics and Publication

Section 08 – Research Methods and Seminar Work

ICS adjusts the clock

For ICS, 90/30 (Google Project Zero) is too aggressive – coordinated rollouts take longer. 180/60 is more typical; document any deviation in the disclosure email.

Source: Google Project Zero policy; ISO/IEC 29147:2018; CERT/CC vulnerability handling policy.

USENIX Security, IEEE S&P, NDSS, CCS

ACSAC, ESORICS, RAID

WOOT, CSCS (ICS-focused)

S4 / DEF CON / BlackHat / Hardwear.io

IEEE Tx Smart Grid, Tx Industrial Inf.

Computers & Security, IJCIP

- Name the vendor PSIRT contact if they cooperated.
- Credit the coordinating CERT (BSI / CISA / JPCERT).
- Cite the disclosure timeline (date sent, date acknowledged, date patched).
- If anonymising the asset owner, say so – and explain why.

Caution

A paper that publishes exploit details before patch availability burns the relationship – with that vendor and the wider community.

4

The Seminar Talk

Section 08 – Research Methods and Seminar Work

1. One-slide problem statement (90 seconds)

2. Why prior work falls short

3. Method or artefact

4. Evaluation – one quantitative chart

5. Limitations + threats to validity

6. Conclusions + next steps

- “How did you handle the obvious confound X ?”
- “What is the smallest realistic deployment that would benefit from this?”
- “Did you measure the operational cost?”
- “How does your approach generalise to vendor Y ?”
- “What does the vendor say?”

Rehearse the hostile question

The strongest defence is a slide in your back pocket that answers the question before it is asked.

- One claim per paragraph; one paragraph per claim.
- Numbers in the abstract; jargon out.
- Reproducibility artifacts as a single zenodo / archive.org capture.
- Pre-print on arXiv after vendor agreement.
- Track citations – they show whether the work is being used.

- Confusing CVE-count with security maturity.
- Generalising from a single vendor or single sector.
- Datasets without ground truth.
- Tools that only work on the author's lab.
- “Future work” that the authors will never do.

Caution

A paper that promises 12 lines of “future work” usually delivers zero. Pick one and finish it instead.

★ Key Takeaway: Doing OT-security research well

- Pick a method that matches the question (case, measurement, experiment, design science).
- Build reproducible artefacts – code, data, container, README.
- Coordinate disclosure on ICS-realistic timelines (180/60 typical).
- Publish where ICS-aware reviewers read; structure talks for a hostile audience.
- Avoid the well-known pitfalls – CVE-count, single-vendor generalisations, no ground truth.
